SEE THE WHOLE PICTURE

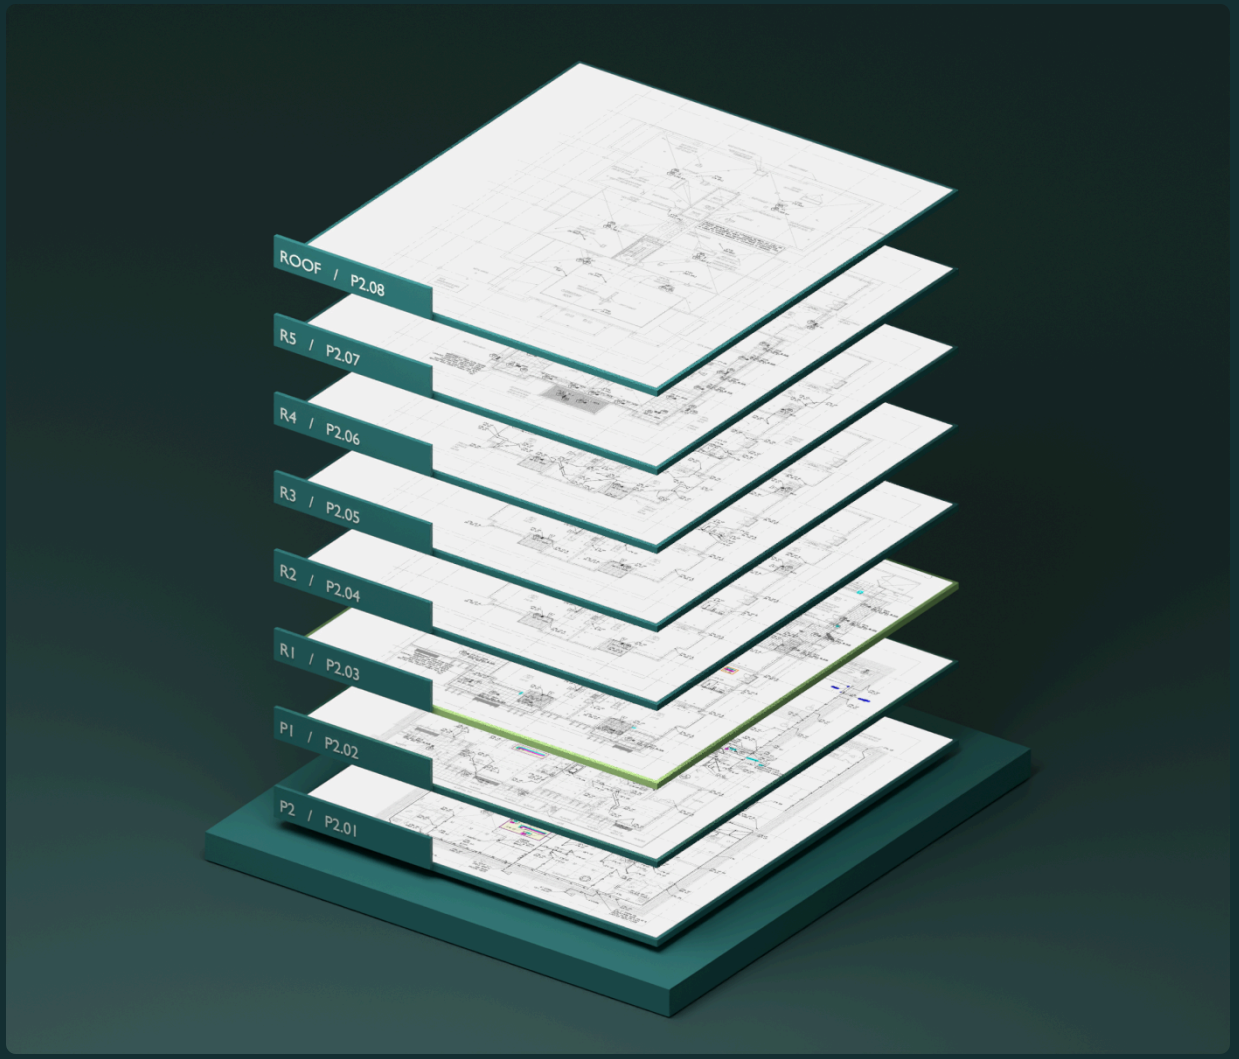

# One building. A shared water story.

An exploded view of the source drawings, from parking level P2 to the roof.

- 8 floor and roof plans
- 19 source sheets
- Original drawings + supplied review markups

Drawing issue: 29 October 2007

This is a visual index of drawing panels. Their scale, alignment and vertical spacing are illustrative; they are not a surveyed model.

START WITH THE RISERS

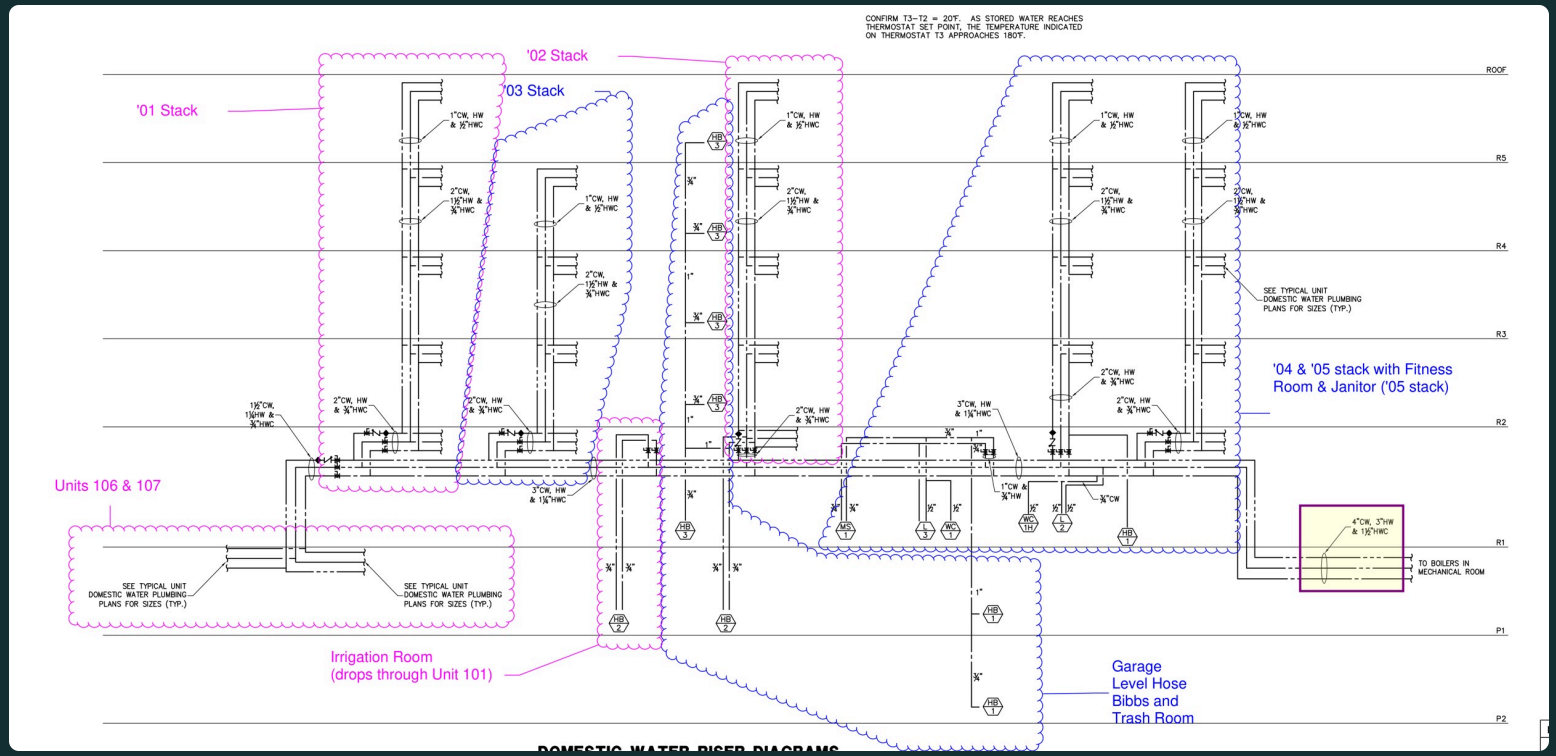

# Understand the shared system.

The domestic water riser diagram brings the levels together in one view.

Review labels identify the ’01, ’02, ’03 and ’04 / ’05 stacks, plus Units 106 & 107 and common-area services.

Owner discussion: which area is under review, and what must be traced in the field?

Stack names alone do not establish valve locations or shutdown boundaries.

CONNECT THE OVERVIEW TO THE DETAIL

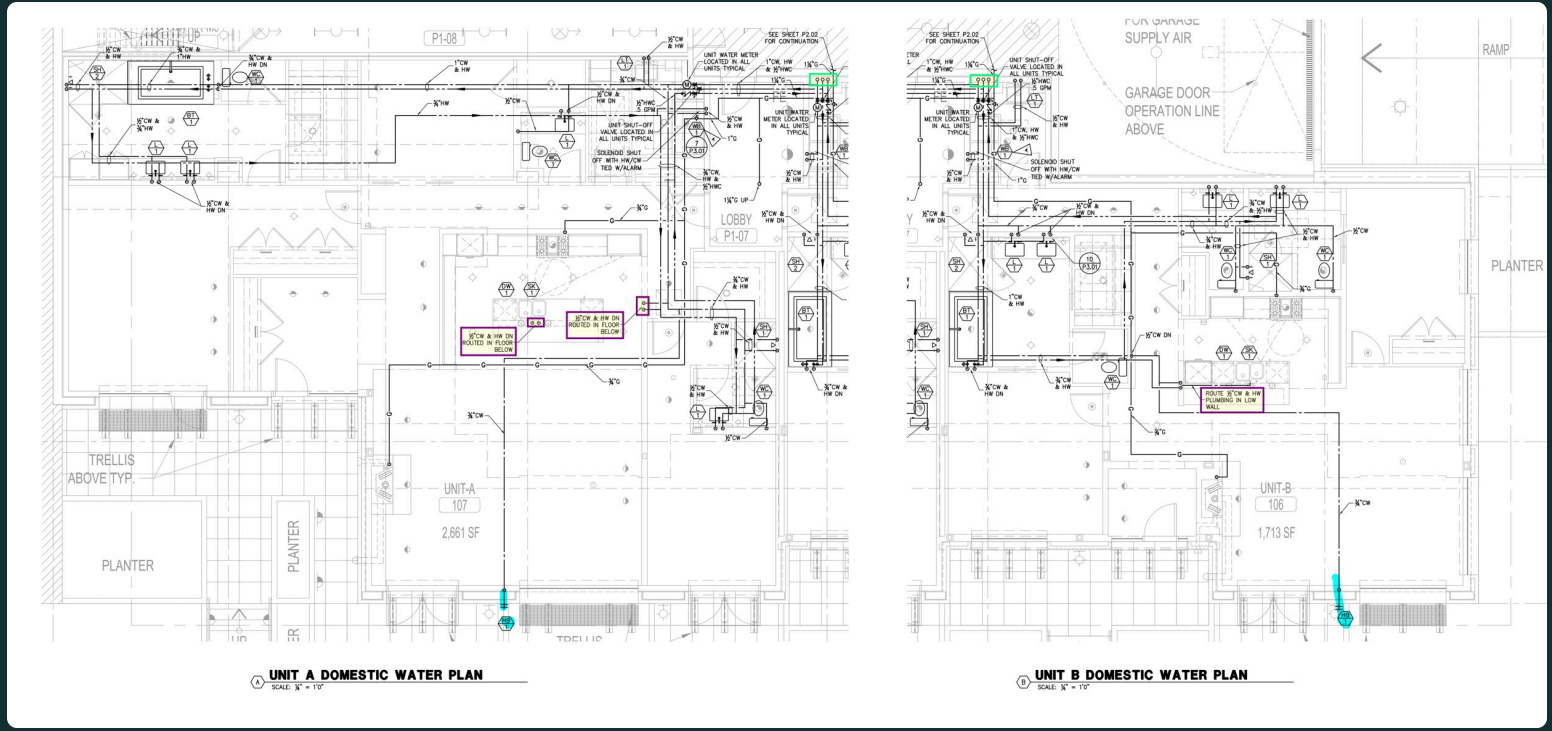

# Then zoom in to the dwelling.

Typical unit sheets show domestic water layouts and callouts for unit shutoffs and meters.

This example shows Unit A / 107 and Unit B / 106.

Owner discussion: what access is needed, and how does the current unit compare with the drawing?

Typical layouts require confirmation against the actual unit and any later modifications.

Source: P4.01 · PDF page 15, Unit A and Unit B domestic water plans.

KEEP THE SMALL NOTES VISIBLE

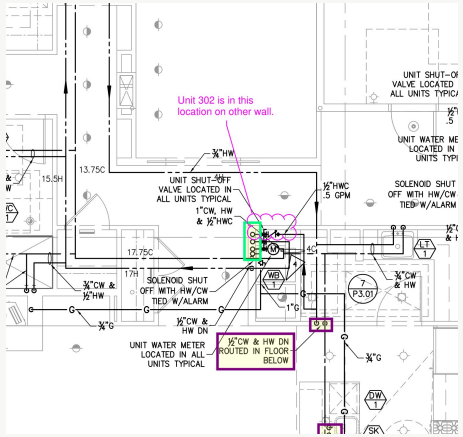

# Exceptions matter.

**Unit 302:** a markup states, “Unit 302 is in this location on other wall.”

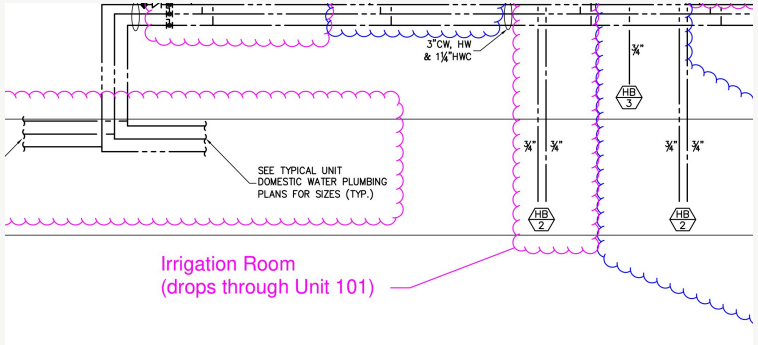

**Irrigation:** another note identifies the irrigation room drop through Unit 101.

Owner discussion: which exceptions change access, coordination or the scope of verification?

These are review annotations in the supplied PDF, not independently verified site conditions.

Sources: P4.02, PDF page 16; P3.02, PDF page 13. Crops preserve the original drawing and review marks.

MOVE FROM DRAWING TO DECISION

# Agree the questions. Then plan the work.

01 Confirm the area and applicable revision.

02 Verify current conditions and access.

03 Trace the relevant system with the project team.

04 Confirm affected occupants and the work plan.

Use the interactive atlas to open the supporting sheet and save observations beside it.

No pipe quantities, physical routes or isolation boundaries have been inferred in this presentation.
