200 WEST HIGHLAND

Photo reference and revised Cycles daylight study

Owner-supplied photo-02

Daylight revision 02 / native Cycles

Camera first. A reproducible pinhole fit uses nine manually selected facade and floor correspondences. The viewpoint is closer to the source, with less foreground lawn and a stronger corner perspective.

Presentation revision. Warmer, less mottled brick; a clear procedural daylight sky; reflective glazing with varied open curtains; pale concrete trim; and layered planted terrace edges.

What the comparison establishes. Visual agreement at selected interpreted landmarks has improved. The roof silhouette, openings and site still differ from the photograph. All 955 protected architectural meshes retain the handoff geometry. The model still has 175 openings and 16 unresolved candidates. No surveyed accuracy or color calibration is claimed.

200 WEST HIGHLAND

Selected camera landmarks and recorded residuals

Yellow circles: manual photo picks / cyan crosses: projected model

Fit method. Robust least squares, centered principal point, square pixels, 36 mm horizontal sensor and no lens distortion. Fitted lens: 27.96 mm.

Selected-point error. Root-mean-square residual: 9.78 px, compared with 49.67 px for the previous camera, at the supplied 665 x 441 image size. Largest residual: 16.37 px.

Limits. These are fitting residuals on the same manual points used to fit the camera. They are not independent accuracy measurements. Unknown cropping, lens distortion and simplified geometry remain. Manual pick uncertainties are 4-10 pixels.

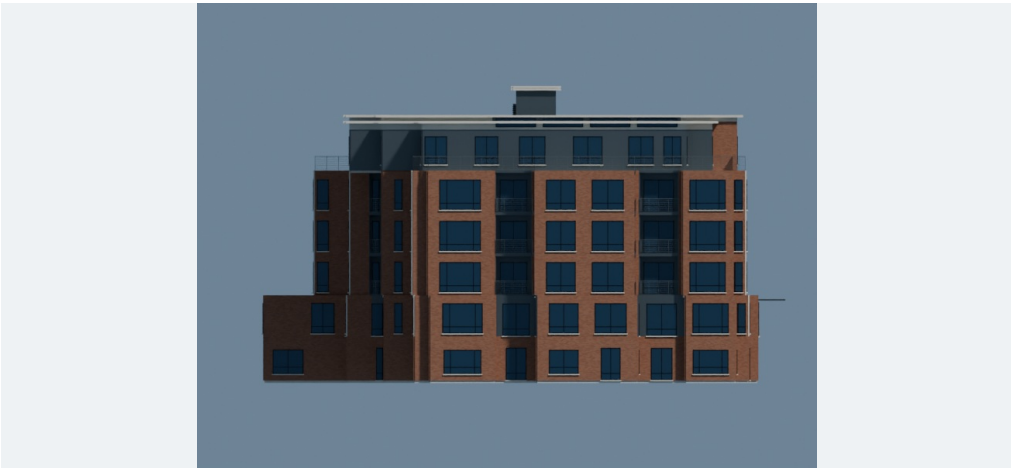

The numbered correspondences, their 3D positions, manual pixel picks, bounds and individual errors are saved in **camera-fit.json**. Blender's native camera projections are checked against the optimizer. No source element is promoted to confirmed status by the fit.

200 WEST HIGHLAND

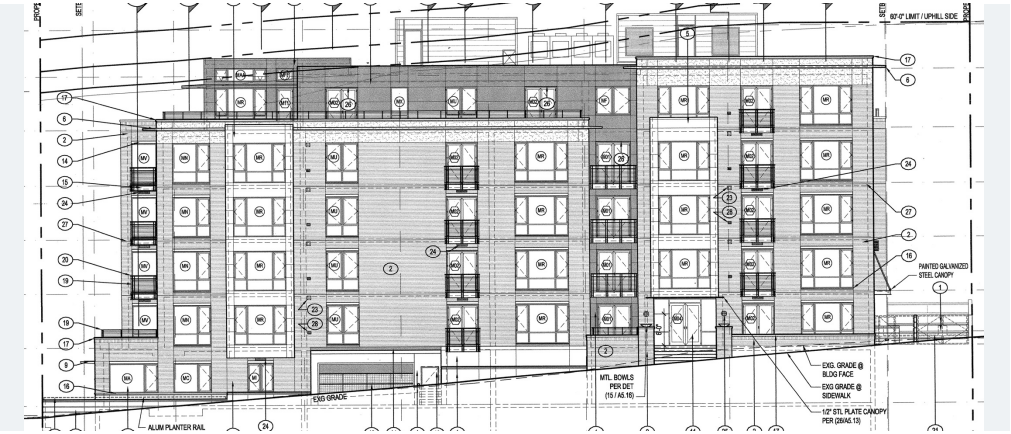

Source elevation patterns / retained architectural geometry

A3.01 south elevation

Handoff orthographic / geometry retained

A3.01 east elevation

Handoff orthographic / geometry retained

These are independently fitted qualitative panels, not measured overlays. The orthographic images are retained from the handoff because the architectural mesh hash is unchanged. The original architectural PDF is absent; original plan/elevation sheets and clearer return photographs are needed to resolve the remaining conflicts.

200 WEST HIGHLAND

All 16 opening conflicts reviewed / no unsupported additions

Record	Face	Level	Center (in)	Width (in)	Recomputed conflict
OPEN-01	south	P1	252.1	55.2	Does not fit return with jamb margin
OPEN-02	south	R1	265.9	59.1	Does not fit return with jamb margin
OPEN-03	south	R2	265.9	59.1	Does not fit return with jamb margin
OPEN-04	north	R2	1393.7	42.2	Does not fit return with jamb margin
OPEN-05	north	R2	146.4	33.7	Outside outward-facing plan spans
OPEN-06	south	R3	265.9	59.1	Does not fit return with jamb margin
OPEN-07	north	R3	1393.7	42.2	Does not fit return with jamb margin
OPEN-08	north	R3	146.4	33.7	Outside outward-facing plan spans
OPEN-09	south	R4	265.9	59.1	Does not fit return with jamb margin
OPEN-10	north	R4	1393.7	42.2	Does not fit return with jamb margin
OPEN-11	north	R4	146.4	33.7	Outside outward-facing plan spans
OPEN-12	south	R5	255.1	37.4	Outside outward-facing plan spans
OPEN-13	south	R5	357.6	61.1	Does not fit return with jamb margin
OPEN-14	south	R5	1333.5	45.0	Does not fit return with jamb margin
OPEN-15	north	R5	251.5	29.7	Outside outward-facing plan spans
OPEN-16	north	R5	146.4	33.7	Outside outward-facing plan spans

Decision. Retain every candidate as unresolved. Pixel registration and outward-facing plan returns cannot establish revised jamb locations from these crops. The inherited six-inch jamb allowance is an assumption, not a documented minimum. Centers and widths above are projected scan coordinates, not verified installed dimensions.

Next source request. Original A2.03/A2.04/A2.07 and A3.01/A3.02 sheets, an opening schedule, and clearer north/return photographs. Detailed evidence is in opening-audit.json and opening-audit.csv.
